Measurement and interpretation

- This report uses AIBAST-only public GitHub, Discussion, jsDelivr, release, and opt-in issue signals. RAR is excluded from every count. It contains no private analytics or tracking pixel.

- Raw GitHub, raw.githubusercontent.com, and direct GitHub Pages file downloads expose no public per-file counter, so download figures are a measurable floor rather than total use.

- GitHub traffic and popular paths require repository Administration: read. Unavailable traffic remains unavailable instead of becoming a fabricated zero.

- Workshop usage combines mixed-window public events and is not a user count. Agent rating upvotes, signed-in acquisitions, and achievement points remain separate signals.

- Verified achievements confirm authenticated GitHub issue authorship and schema only; the underlying self-reported completion is not independently proven.

- A native upvote on an agent rating Discussion records preference. A native upvote on its acquisition Discussion records one signed-in account's declared download, copy, or install. Neither replaces observable CDN or release file-transfer counts.
