Measurement and interpretation

- This report uses public GitHub, jsDelivr, release, and opt-in issue signals. It contains no private analytics or tracking pixel.
- Raw GitHub, raw.githubusercontent.com, and direct GitHub Pages file downloads expose no public per-file counter, so download figures are a measurable floor rather than total use.
- GitHub traffic and popular paths require repository Administration: read. Unavailable traffic remains unavailable instead of becoming a fabricated zero.
- Workshop usage combines mixed-window public events and is not a user count. Agent upvotes and AGI Points remain separate signals.
- Verified AGI confirms authenticated GitHub issue authorship and schema only; the underlying self-reported achievement completion is not independently proven.
- Global agent fetch events add distinct observable AIBAST and public RAR distribution channels. They are fetch events, not people, and RAR's censored CDN file list makes the combined figure a floor.
- RAR signed-in acquisitions and worked, regular-use, shipped, and other reactions are separate opt-in signals. They are never added to fetches or interpreted as unique users.
